

Fever of Unknown Origin

Irene Frantzis
Sheba Medical Center
Internal Medicine Department
P year 2013

definition

- 1961- FUO was seen as temperature $>38.3^{\circ}\text{C}$ on several occasions, fever >3 weeks duration, and with >1 week of inpatient investigation
- Now:
 - Classic FUO
 - Nosocomial FUO
 - Neutropenic FUO
 - FUO associated with HIV

Classic FUO

- >38.3 C
- 3 outpatient visits or
- 3 days in hospital or
- 1 week of “intelligent and invasive” ambulatory investigation

Nosocomial FUO

- >38.3 C (101 F) develops on several occasions in hospital patient
- No infection on admission
- 3 days of investigation and >2 days incubation of culture

Neutropenic FUO

- >38.3 C on several occasions
- Neutrophil count < 500/ μ L
- 3 days investigation
- More than 2 days incubation of culture

FUO associated with HIV

- 38.3 C for > 4wks outpatient, >3 days hospital
- HIV
- 3 days investigations, >2 day cultures

Causes of Classic FUO

1961

- Infections: 36%
- Neoplasms: 19%
- Inflammatory: 19%
- Miscellaneous: 19%
- Undiagnosed: 7%

2007

- Infections: 16%
- Neoplasms: 7%
- Inflammatory: 22%
- Miscellaneous: 4%
- Undiagnosed: 51%

For a full list of causes of FUO, please turn to table 18-2 in Harrison's

Infections

Localized pyogenic infections

- Appendicitis
- Cat-scratch disease
- Cholangitis
- Cholecystitis
- Dental abscess
- Diverticulitis/abscess
- Lesser sac abscess
- Liver abscess
- Mesenteric lymphadenitis
- Osteomyelitis
- Pancreatic abscess
- Pelvic inflammatory disease
- Perinephric/intrarenal abscess
- Prostatic abscess
- Renal malacoplakia
- Sinusitis
- Subphrenic abscess
- Suppurative thrombophlebitis
- Tuboovarian abscess

Intravascular infections

- Bacterial aortitis
- Bacterial endocarditis
- Vascular catheter infection

Systemic bacterial infections

- Bartonellosis
- Brucellosis
- Campylobacter* infection
- Cat-scratch disease/bacillary angiomatosis (*B. henselae*)
- Gonococcemia
- Legionnaires' disease
- Leptospirosis
- Listeriosis
- Lyme disease
- Melioidosis
- Meningococcemia
- Rat-bite fever
- Relapsing fever
- Salmonellosis
- Syphilis
- Tularemia
- Typhoid fever
- Vibriosis
- Yersinia* infection

Infections

1. Extrapulmonary TB, typhoid, Malaria
2. Delayed Antibody response to EBV, CMV, HIV
3. Intra-abdominal abscesses- difficult
4. Renal malacoplakia → life threatening
5. Osteomyelitis- especially if prosthetic devices
6. Endocarditis by HACEK

Infections

- Fungal diseases and protozoa
 - Histoplasmosis
 - Aspergillosis
 - Pneumocystis infection
 - If have headache → CSF culture for cryptococcus neoformans, M. Tuberculosis

Inflammatory

- ◉ Polymyalgia Rheumatica
- ◉ Lupus
- ◉ Adult Still's
- ◉ Sarcoidosis
- ◉ Crohn's
- ◉ Granulomatous hepatitis

In the elderly

1. Giant Cell arteritis (15-20%)
2. Tuberculosis
3. Colon cancer

Miscellaneous

- ◉ Drug induced fever
- ◉ PE
- ◉ Factitious fever (esp. young women in health professions)
- ◉ Hereditary periodic fever (FMF, hyper IgD, familial Hiberian fever)
- ◉ Familial cold urticaria
- ◉ Fabry, Gaucher's
- ◉ Thermoregulatory disorders (pheochromocytoma, hypothalamic dysfunction etc)

Drug- induced fever

- Antibiotics
 - β lactams
- Cardiovascular drugs (ex. Quinidine)
- Antineoplastic drugs
- Drugs acting on CNS (ex. Phenytoin)

Diagnosis- things to consider

- Patient's country of origin
- Recent and remote travel
- Environmental exposures
- Pets
- Immunosuppression, disease- modifying interventions (TNF- α suppression)
 - Can hide infections or make old ones reappear

Fever > 38°C (100.4°F) x 3 weeks; 1 week of "intelligent and invasive investigation"

Physical exam

Repeat history

Laboratory Testing

CBC, Diff, smear, ESR, CRP, urinalysis, liver function tests, muscle enzymes, VDRL, HIV, CMV, EBV, ANA, RF, SPEP, PPD, control skin tests, creatinine, electrolytes, Ca, Fe, transferrin, TIBC, vitamin B₁₂; acute/convalescent serum set aside

Cultures: Blood, urine, sputum, fluids as appropriate

Potentially diagnostic clues^a

No potentially diagnostic clue^a

Directed exam

CT of chest, abdomen, pelvis with IV or PO contrast; colonoscopy

-

+

-

+

⁶⁷Ga scan, ¹¹¹In PMN scan, FDG PET scan

-

+

Needle biopsy^b, invasive testing^c

Diagnosis

No diagnosis

Specific therapy

Empirical therapy^d

Watchful waiting

Anti-TB therapy,
antimicrobial
therapy

Colchicine, NSAIDs

Steroids

CBC
HIV

Laboratory Testing

CBC, Diff, smear, ESR, CRP, urinalysis, liver function tests, muscle enzymes, VDRL, HIV, CMV, EBV, ANA, RF, SPEP, PPD, control skin tests, creatinine, electrolytes, Ca, Fe, transferrin, TIBC, vitamin B₁₂; acute/convalescent serum set aside

Cultures: Blood, urine, sputum, fluids as appropriate

- Elevated ESR + anemia → giant cell arteritis, polymyalgia rheumatica
- Elevated ESR, leukocytosis, anemia, arthralgia, polyserositis, lymphadenopathy, splenomegaly, rash → Still's disease
- CRP can be used as cross-reference for ESR
- Elevated ACE → sarcoidosis?

Laboratory Testing

CBC, Diff, smear, ESR, CRP, urinalysis, liver function tests, muscle enzymes, VDRL, HIV, CMV, EBV, ANA, RF, SPEP, PPD, control skin tests, creatinine, electrolytes, Ca, Fe, transferrin, TIBC, vitamin B₁₂; acute/convalescent serum set aside

Cultures: Blood, urine, sputum, fluids as appropriate

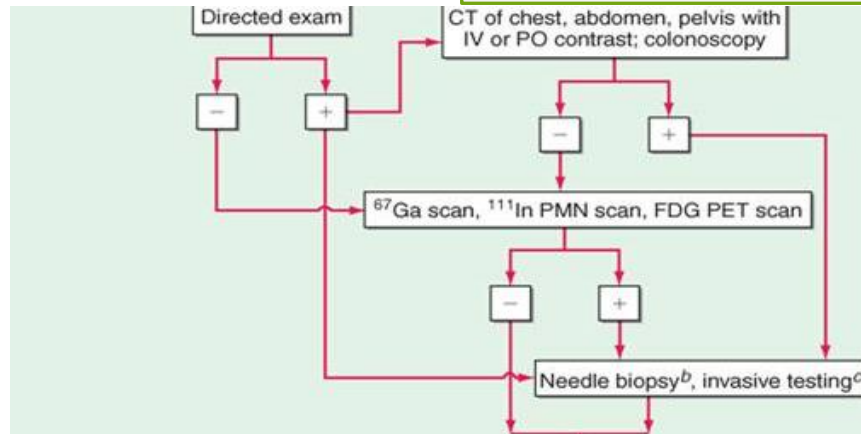

- Need specialized media if travel history suggests uncommon causes of endocarditis (Histoplasma, Chlamydophila, Mycoplasma, Bartonella etc)
- Cultures positive for multiple organisms can indicate self- injection
- VDRL= venereal diseases research lab test

For infections- new development

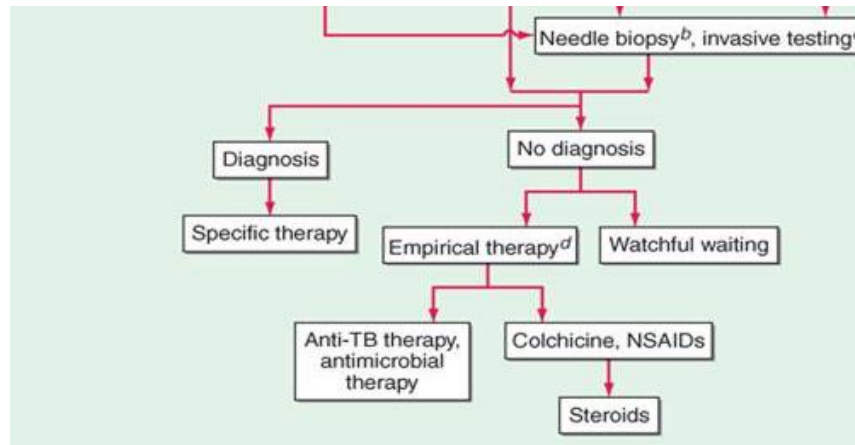

- Use of microarray (with PCR) containing probes of
 - all recognized virus species hosted by vertebrates
 - 135 bacterial species
 - 73 fungal species
 - 63 parasite species

- Potentially diagnostic clues= de Klein et al for key findings in history, localizing signs, key symptoms
- CXR if new symptoms
- If pulmonary signs → sputum induced and bronchoalveolar lavage
- MRI better at detecting spinal/ paraspinal lesion, abscesses, aortic dissection
- Upper GI endoscopy with contrast + colonoscopy (especially in elderly)

- Prolonged fever → liver, bone marrow biopsy
 - Look for bacteria, mycobacteria, fungi
- ⁶⁷Ga useful in localizing inflammatory process
 - Crohn's, sarcoidosis

- Empirical therapy is last resort.
- Most patients with FUO have a good prognosis without a diagnosis
- Exploratory laparotomy is also done as final measure, but now has been replaced with more imaging techniques

Treatment- Classic FUO

- Consider empirical early on in the elderly
- Avoid empirical therapy unless vital sign instability or neutropenia
 - Also consider if there is cirrhosis, asplenia, DMARD use, immunosuppressive drugs, exotic travel
- Continued observation, examination
- Glucocorticoids → drastic change if temporal arteritis, polymyalgia rheumatica, granulomatous hepatitis
- NSAID → dramatic change if rheumatic fever or Still's
- Avoid glucocorticoids, NSAID unless rule out infection

Nosocomial FUO

- >50 % are infections
 - IV lines, phlebitis, prostheses
 - C. Difficile
- Focus on sites where may be infected
- 25% non-infectious (DVT, PE, Drug, withdrawal, adrenal insufficiency, thyroiditis, pancreatitis, acalculous cholecystitis)
- Accelerated pace of diagnostic test, CT, MRI, USS
- IV lines change, drugs stopped for 72 hrs, empirical therapy + vancomycin for MRSA

Neutropenic FUO

- ◉ Bacteria, fungal infections
- ◉ Bacteremia, catheters, perianal infections
- ◉ Candida, Aspergillus → common
- ◉ HSV, CMV
- ◉ Extensive guidelines
- ◉ Vancomycin + ceftazimide, cefepime or carbapenem, +/- aminoglycoside

HIV associated FUO

- HIV alone can cause fever
- Blood cultures, CXR, biopsy, serologic studies (cryptococcal antigen)
- Myc. Avium, M. intracellulare, TB, toxoplasmosis, CMV, Pneumocystitis, nonhodgkin lymphoma, drug-induced
- Tx depends on many factors
